

WORKSHOP BRIEF

INTRODUCTION TO HTML / CSS

Using the basic rules of HTML and CSS, create the following four layouts.

INSTRUCTIONS

Write your HTML using semantic HTML5 tags such as <header>, <main>, <footer>, etc.

Apply your styles using inline CSS (inside the HTML file, within the style="" attribute).

Focus on practicing structure + style together:

Build a simple page skeleton with semantic tags.

Add text and placeholder content to define sections.

Style these sections with CSS properties (colors, borders, spacing, fonts).

Copy this layout three times and add content according to the content.txt file.

Customise each layout with personal suggestions.

DELIVERABLE

Four HTML files containing the four layouts.

Each layout should demonstrate the correct use of semantic tags and basic CSS styling.
